

Armed Forces College of Medicine AFCM

Histological structure of Liver & Gall bladder

Dr. Hanan A. Saleh

Prof. of Histology & Cell Biology

Intended Learning Outcomes

- By the end of this lecture you should be able to:
- Describe the cells lining the blood sinusoids.
- Describe the structure of the space of Disse.
- Correlate the structure of space of Disse to its function.
- Correlate the structure to the function of Ito cells (Hepatic stellate cells).
- Describe the structure of intra and extra hepatic biliary passages and gall bladder.
- Describe the structure of gall bladder.

Liver

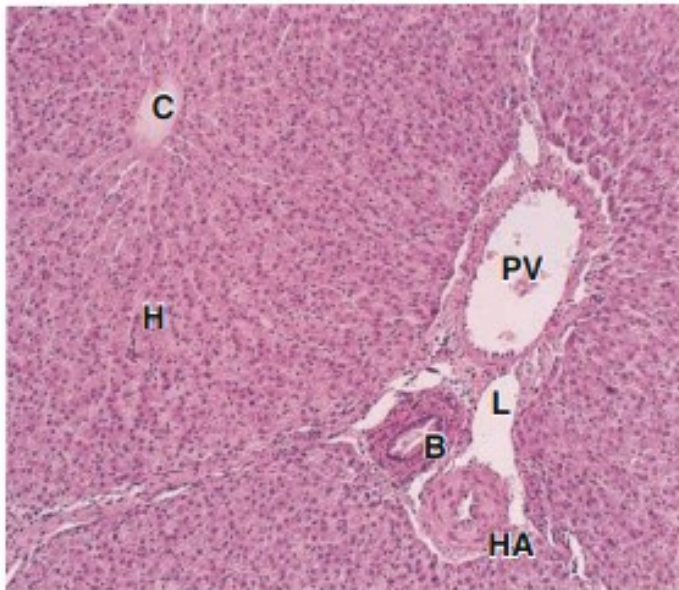

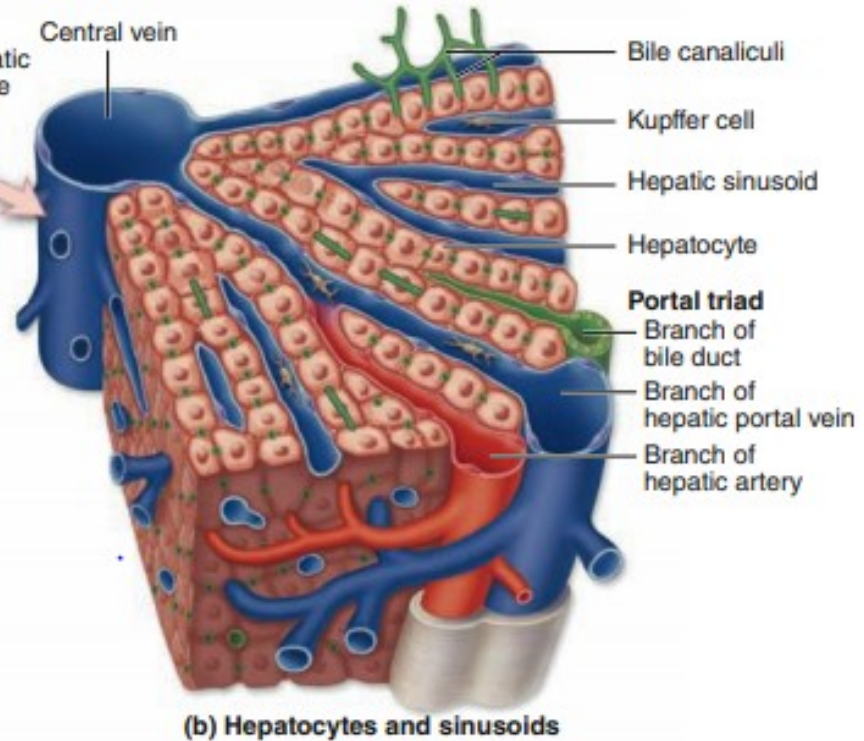

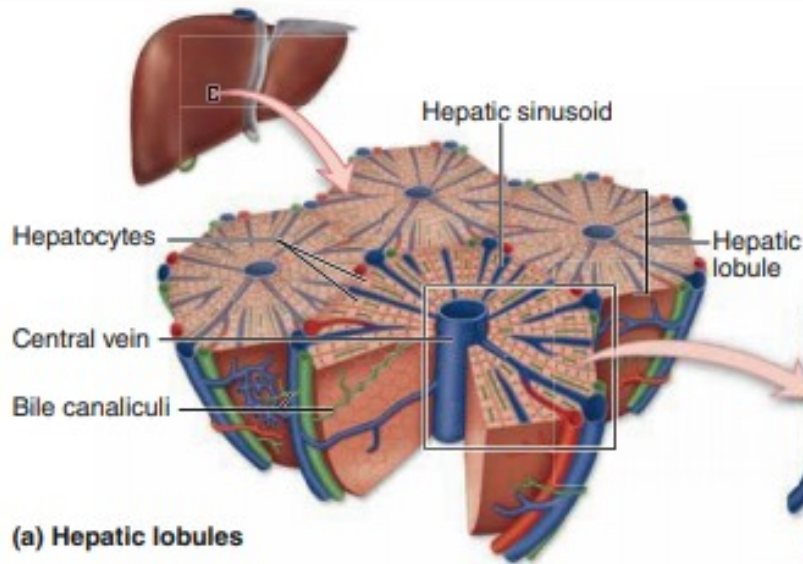

Key Points

- The microscopic structure of the blood sinusoids.
- The microscopic structure of the space of Disse.
- Structure/function relationship of space of Disse .
- Ito cells (Hepatic stellate cells).
- The structure of intra and extra hepatic biliary passages and gall bladder.

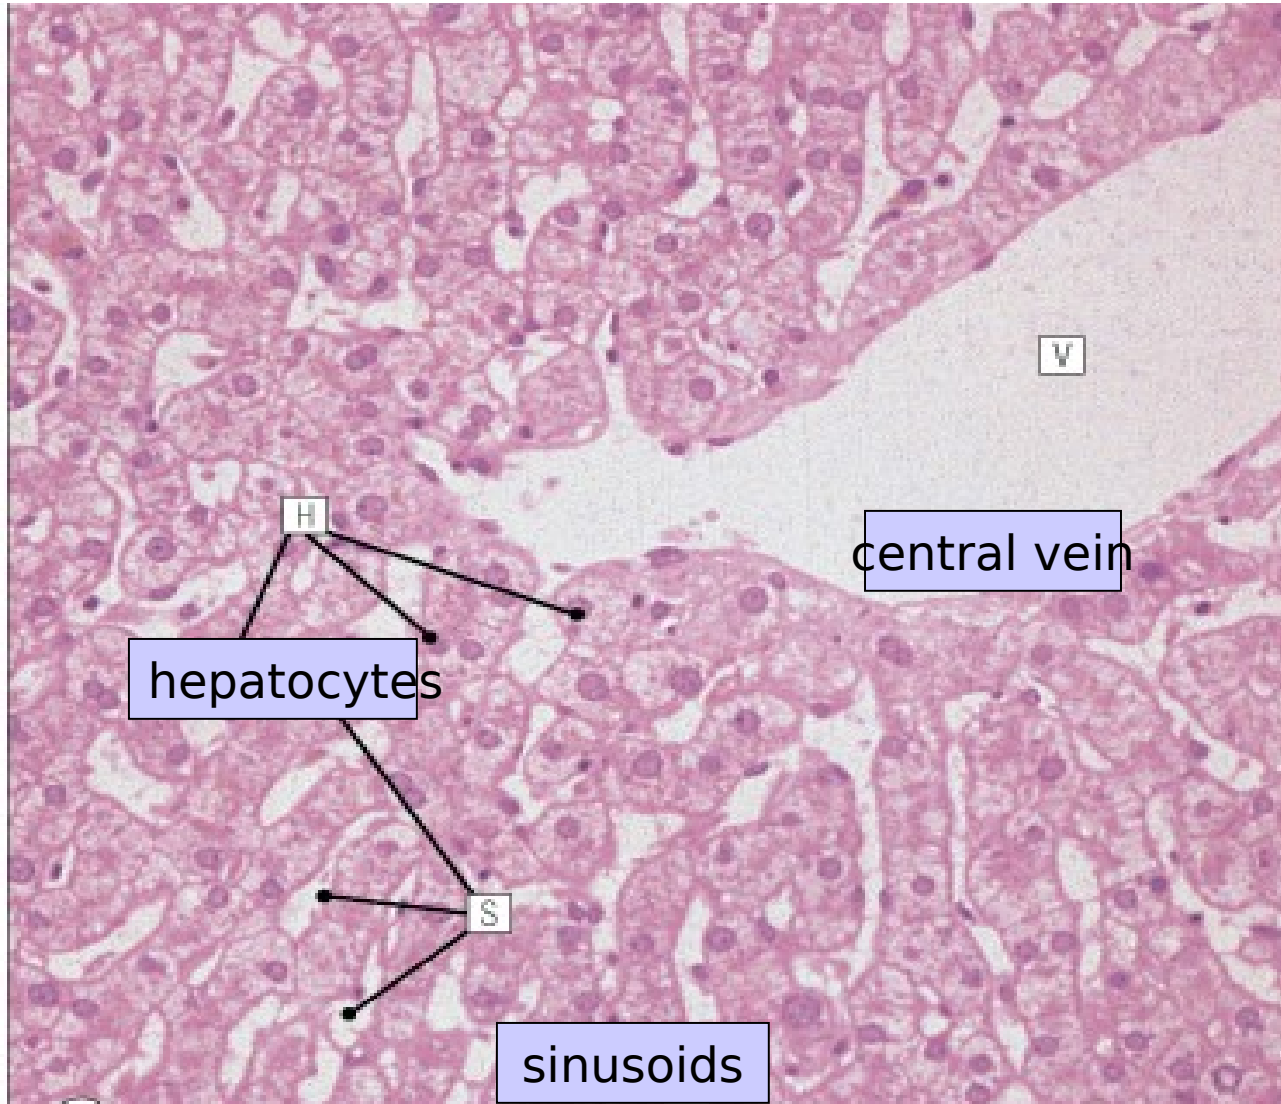

The Liver

Mescher AL: Junqueira's Basic Histology: Text and Atlas, 14th Edition

Blood sinusoids

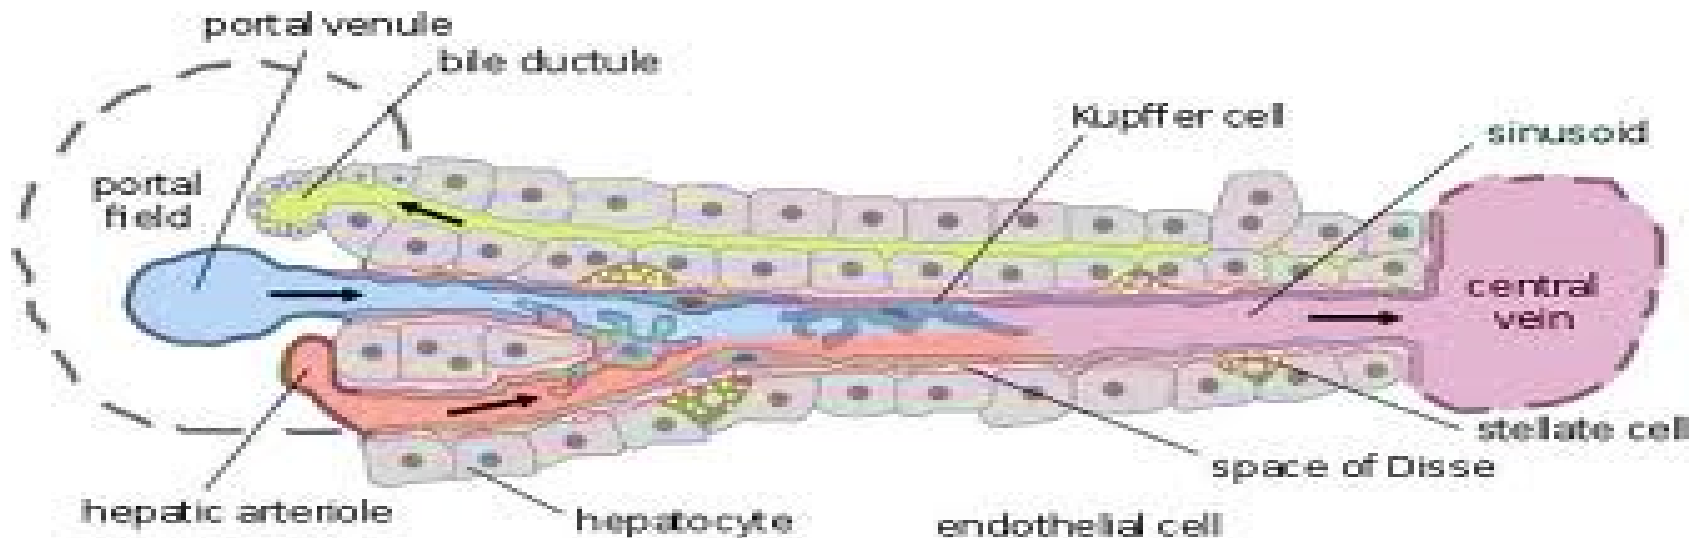

<https://lh3.googleusercontent.com/oEW8HeqwzmhtPSo6X33RFYenId8PY7VxWyjb9pwDOxV6S8Zok9EfB-jtMAe0YUiX-32I=s85>

Blood sinusoids

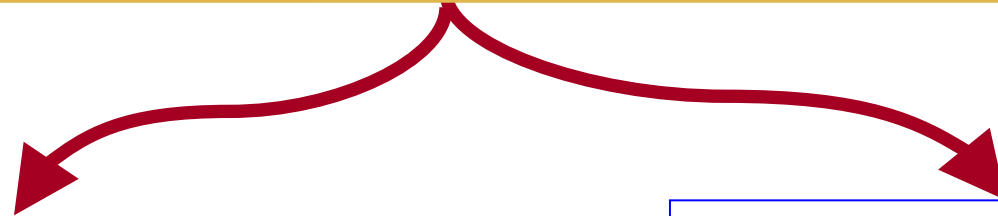

- **Are blood channels present between the hepatocytes that conduct blood from the portal area to the central vein.**

https://lh3.googleusercontent.com/JutTuHBaLWL0dnfz4W6f_aQTl72Aee1hK-tC0YgNuo8hFFphPMewfCSbJAJ_ufndfBpz=s170

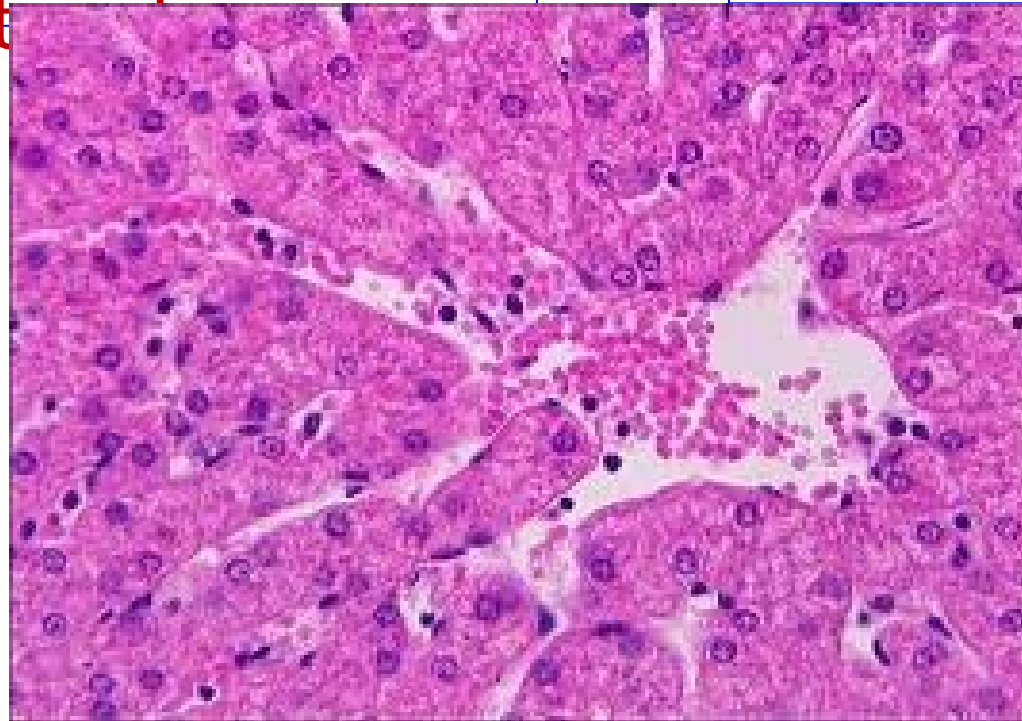

Blood sinusoids

Blood channels
between
hepatocytes

Carry blood from
PA to CV

https://lh3.googleusercontent.com/S2mSoMMt14YuvyzWQJbNZgFfs5Y0Atui9wDtUi3xnld8zV4Cjn6r_kmixMx2+512L

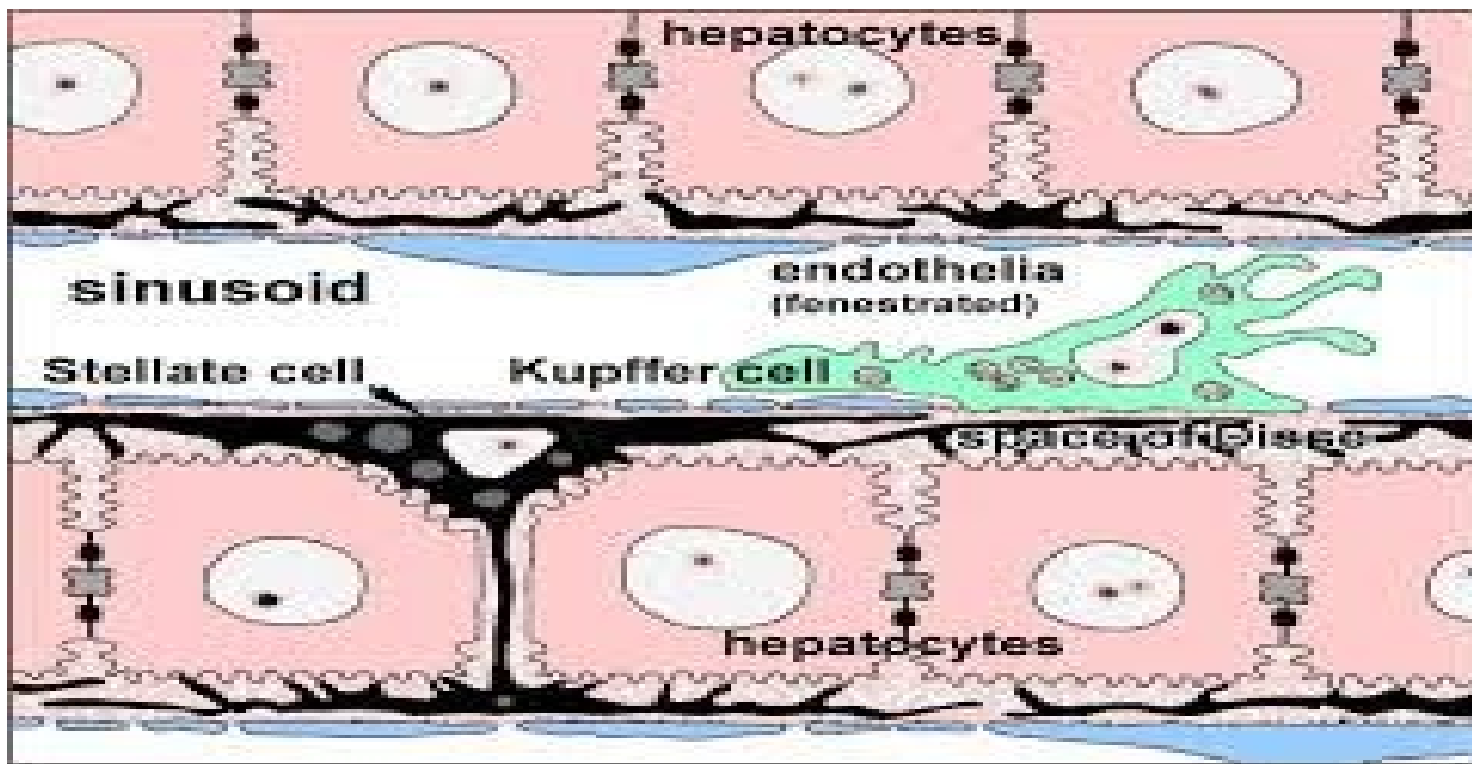

Blood sinusoids are lined by:

**Endothelial
cell**

**Von Kuppfer
cell**

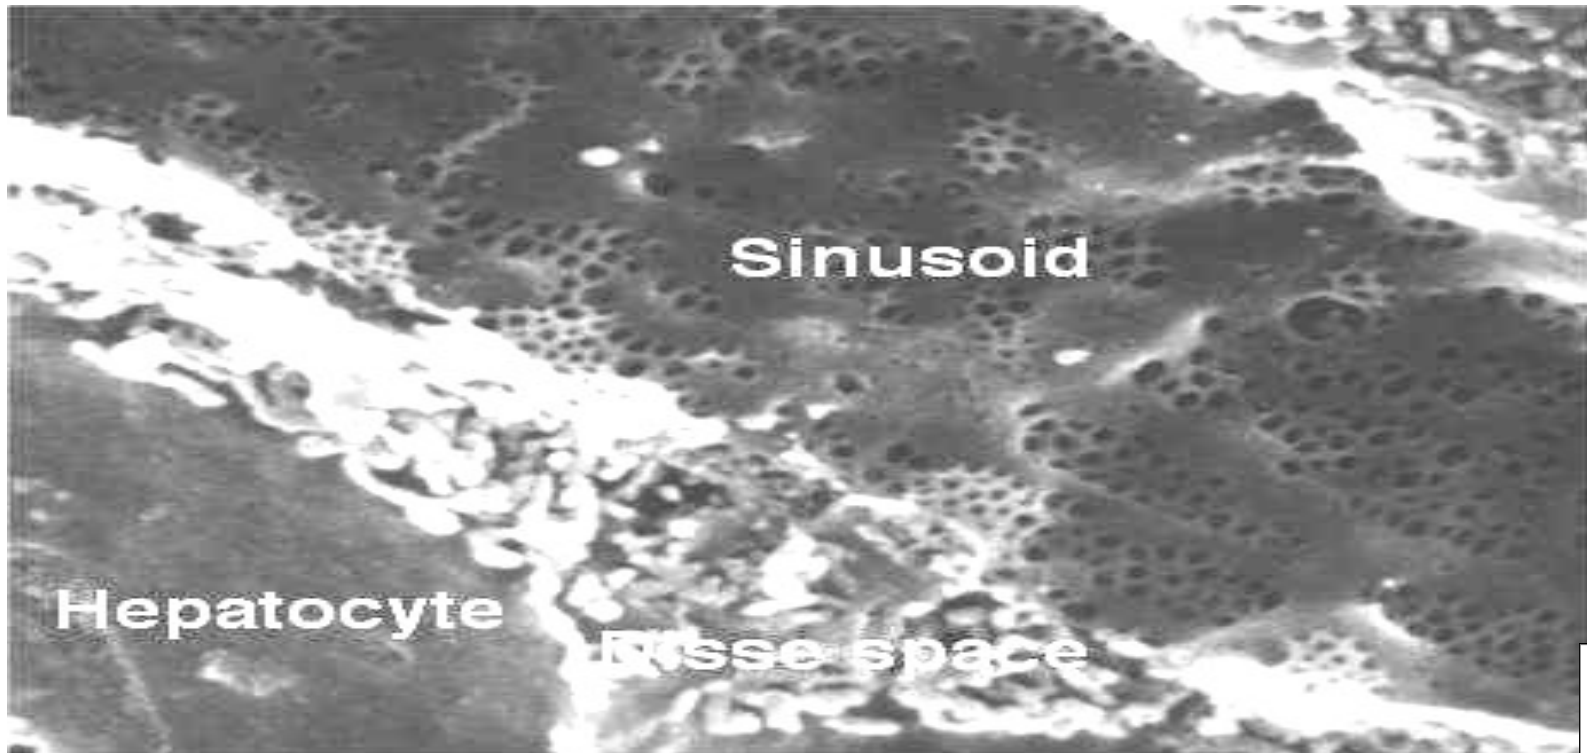

https://lh3.googleusercontent.com/B-rZA3rbPoBEKiOArqRw5sCI4LWb0aOYyGAM7g60O_5aaLQTnhIPn3EzgDtLKRj3YmyPw=s97

Endothelial cells

- **Fenestrated cells**
- **Fenestrations and pores lack diaphragm.**
- **There are spaces between the endothelial cells.**

S
O

Von Kupffer cells

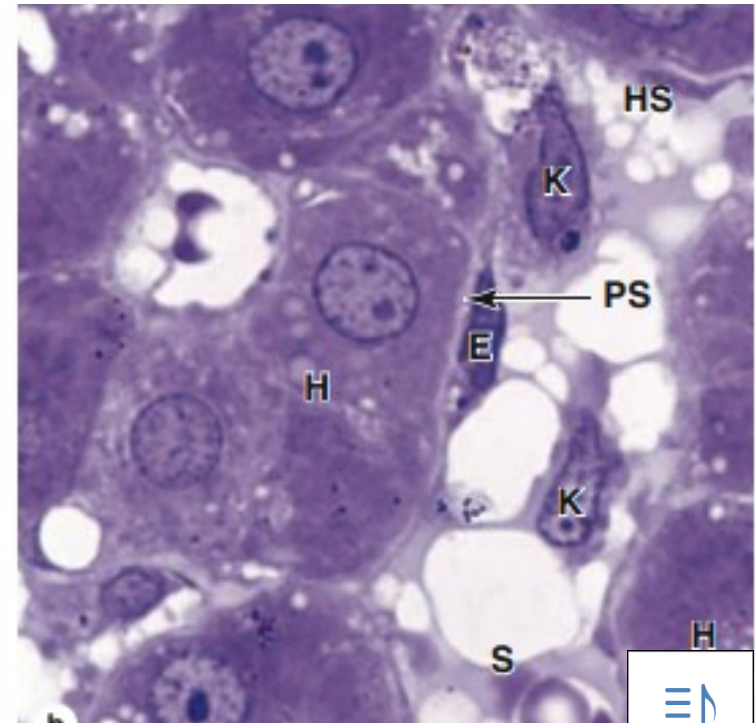

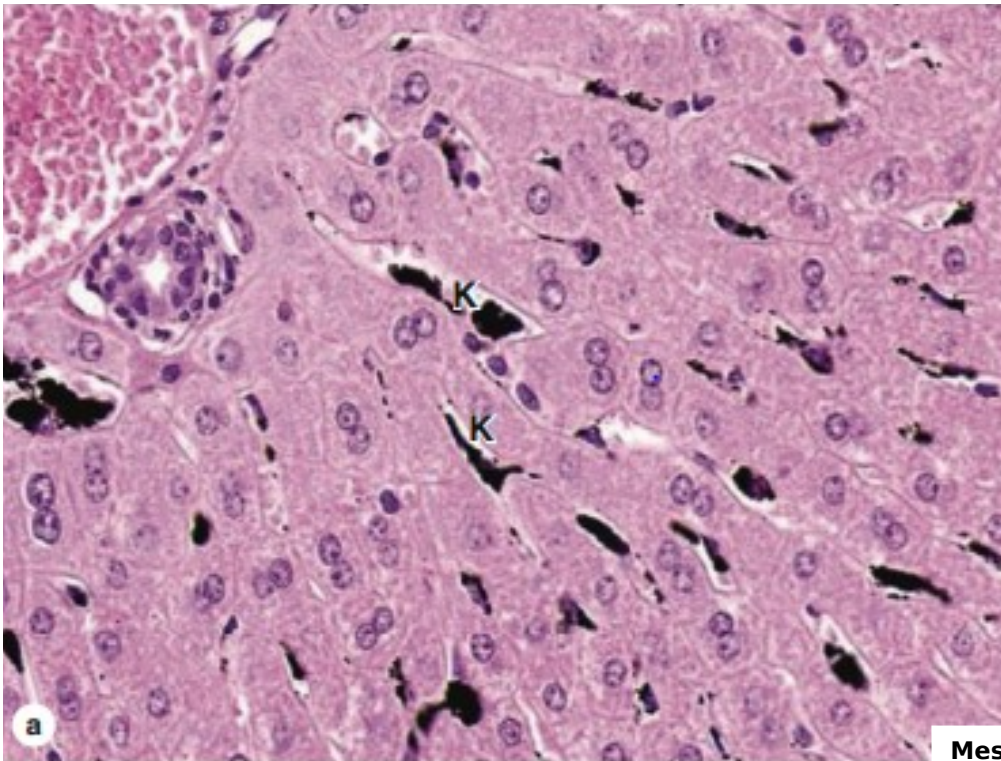

Large phagocytic branching cells between the endothelium.

Origin: monocytes.

LM : nucleus is large and irregular

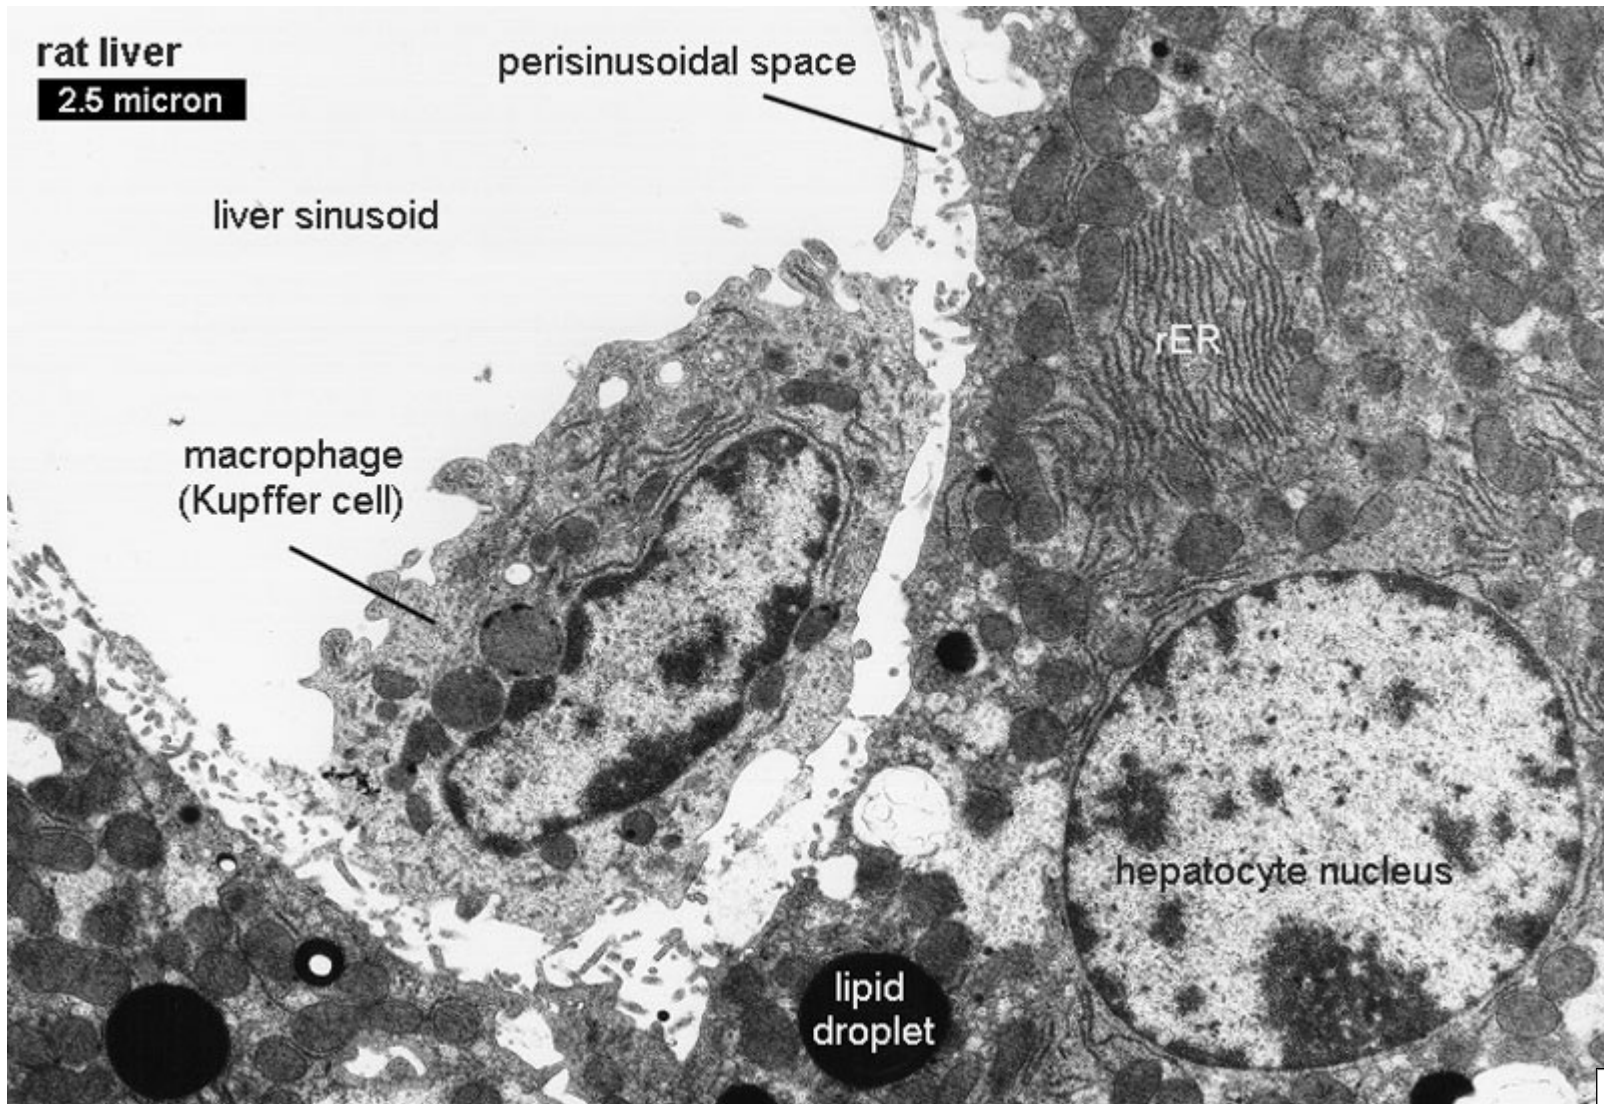

EM: surface microvilli and pseudopodia, lysosomes, rER, Golgi apparatus, phagocytic vesicles.

Mescher AL: Junqueira's Basic Histology: Text and Atlas
<http://www.accessmedicine.com>

Von kupffer cells

<https://lh3.googleusercontent.com/talEgXakmfEZq0axnYw8kn6Jgiumiw4tnNfkMi-Y-2p3Bc3OExZGPvRH9j7NNwV1CvlnRw=s1214>

Von kupffer cells

- **Function:**
 1. **Phagocytosis** of foreign bodies and bacteria.
 2. **Phagocytosis** of old RBC and free the iron for reuse.
 3. Prevents obstruction of the sinusoids by debris coming from the gut.
 4. Antigen presenting cell.

Question

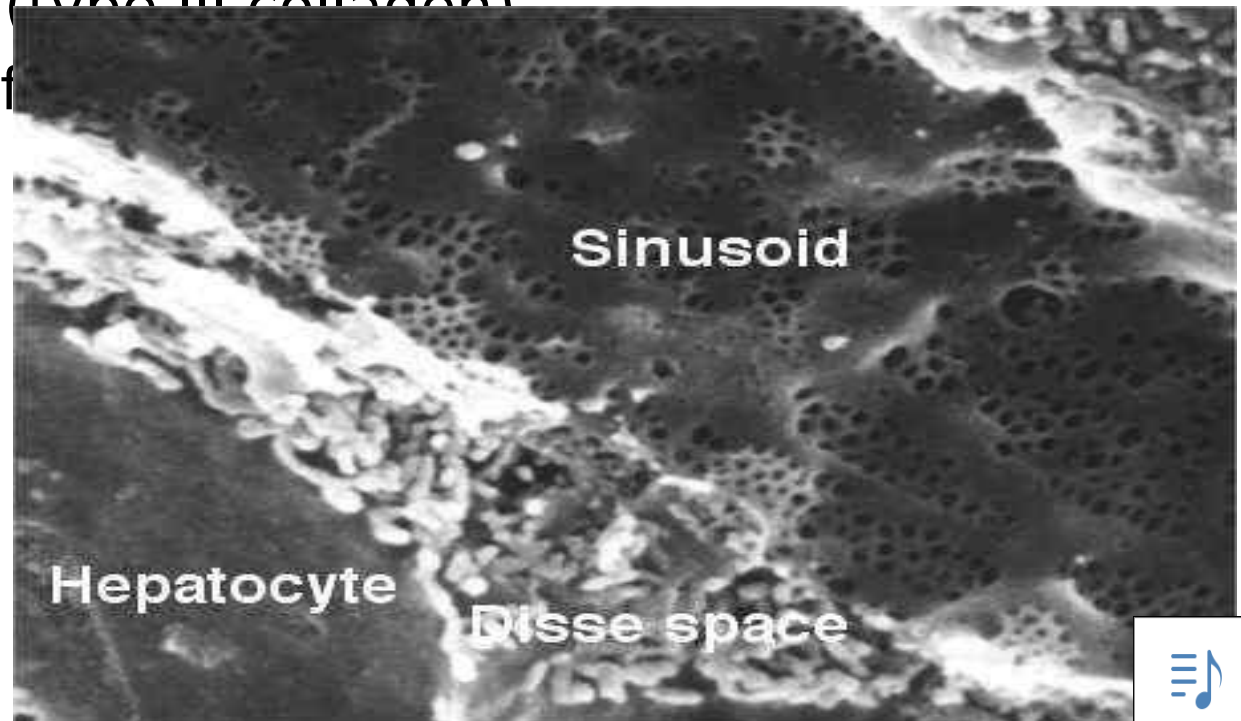

- Which of the following is NOT a characteristic feature of von Kupffer cells?
- a. Fenestrations and pores
- b. Numerous lysosomes
- c. Pseudopodia
- d. Phagocytic vesicles

Space of Disse

- **Between the hepatocytes and sinusoidal wall & contains:**
 - **Microvilli:** from the hepatocytes.
 - **Plasma.**
 - **Ito cells** : fat storing containing vitamin A -rich lipid inclusions.
 - **Reticular fibers** (type III collagen)
 - Occasional nerve fibers

<https://lh3.googleusercontent.com/O4ISWuFcexDCDU9B-zwp4h-LNFqtlgA-kJe-doPYNug7KON9ZILjrAVndQbjDA0Qhx4G=s113>

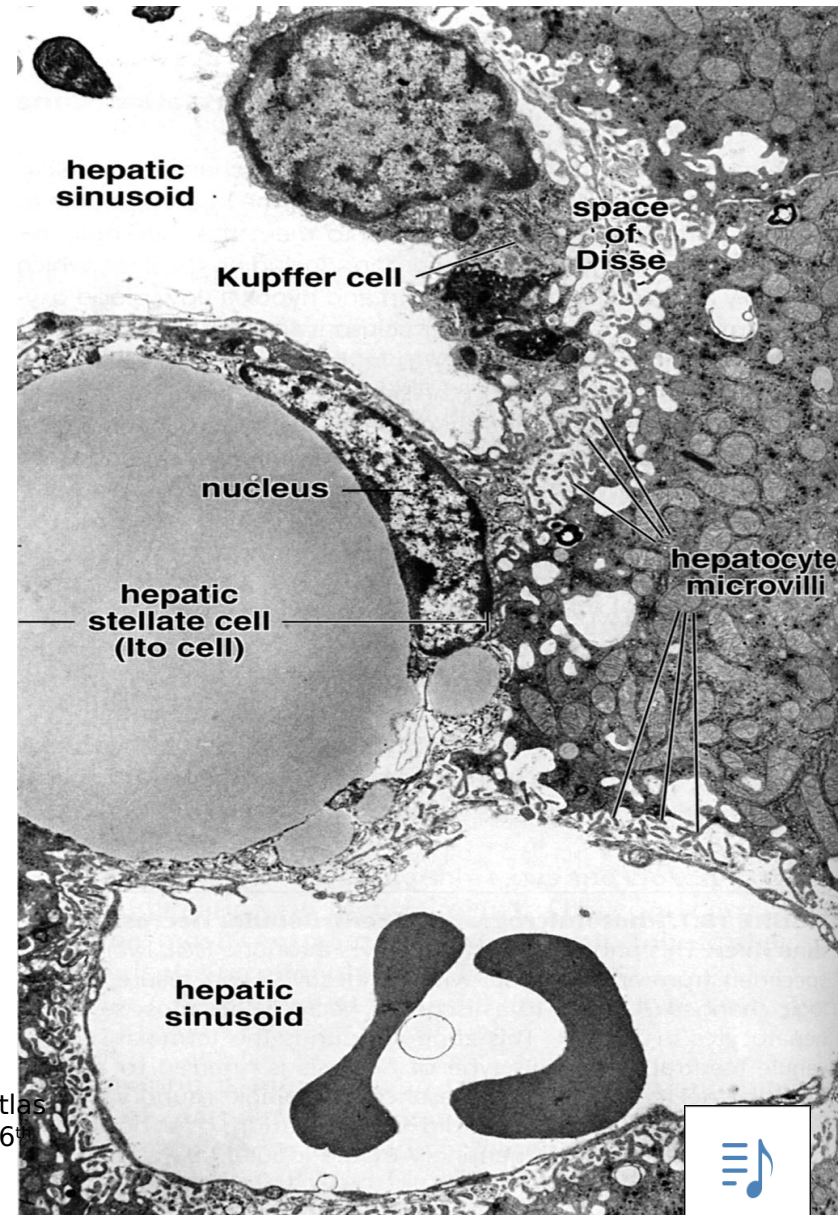

Space of Disse

Ito cells (Hepatic stellate cells):

- Contain lipid droplet.
- Contain **vitamin-A**
- Stores much of the body's vitamin A.
- In diseases: Ito cells proliferate to fibroblast. Leading to fibrosis.

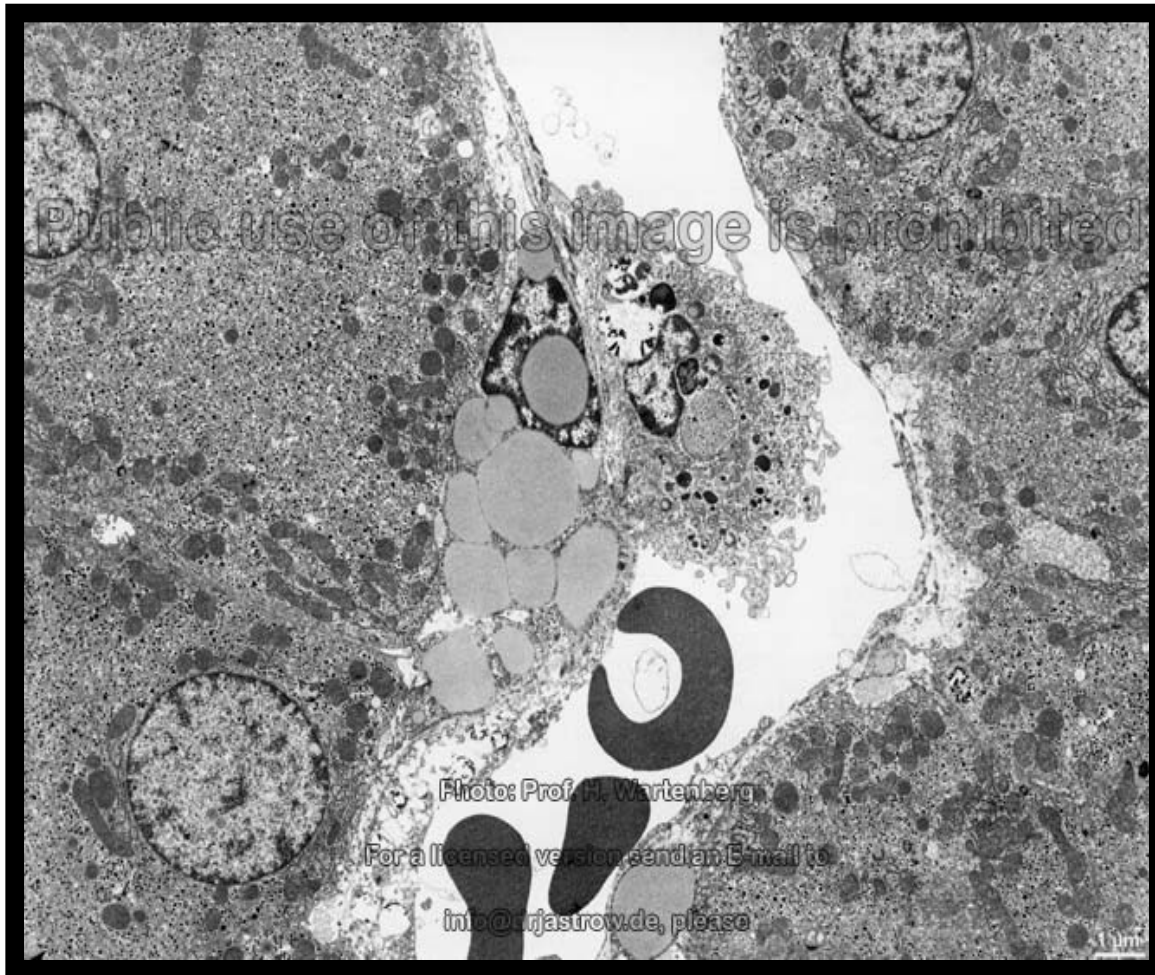

Ross MH, Pawlina W: Histology A Text & Atlas with correlated Cell & Molecular Biology, 6th Edition.

Space of Disse

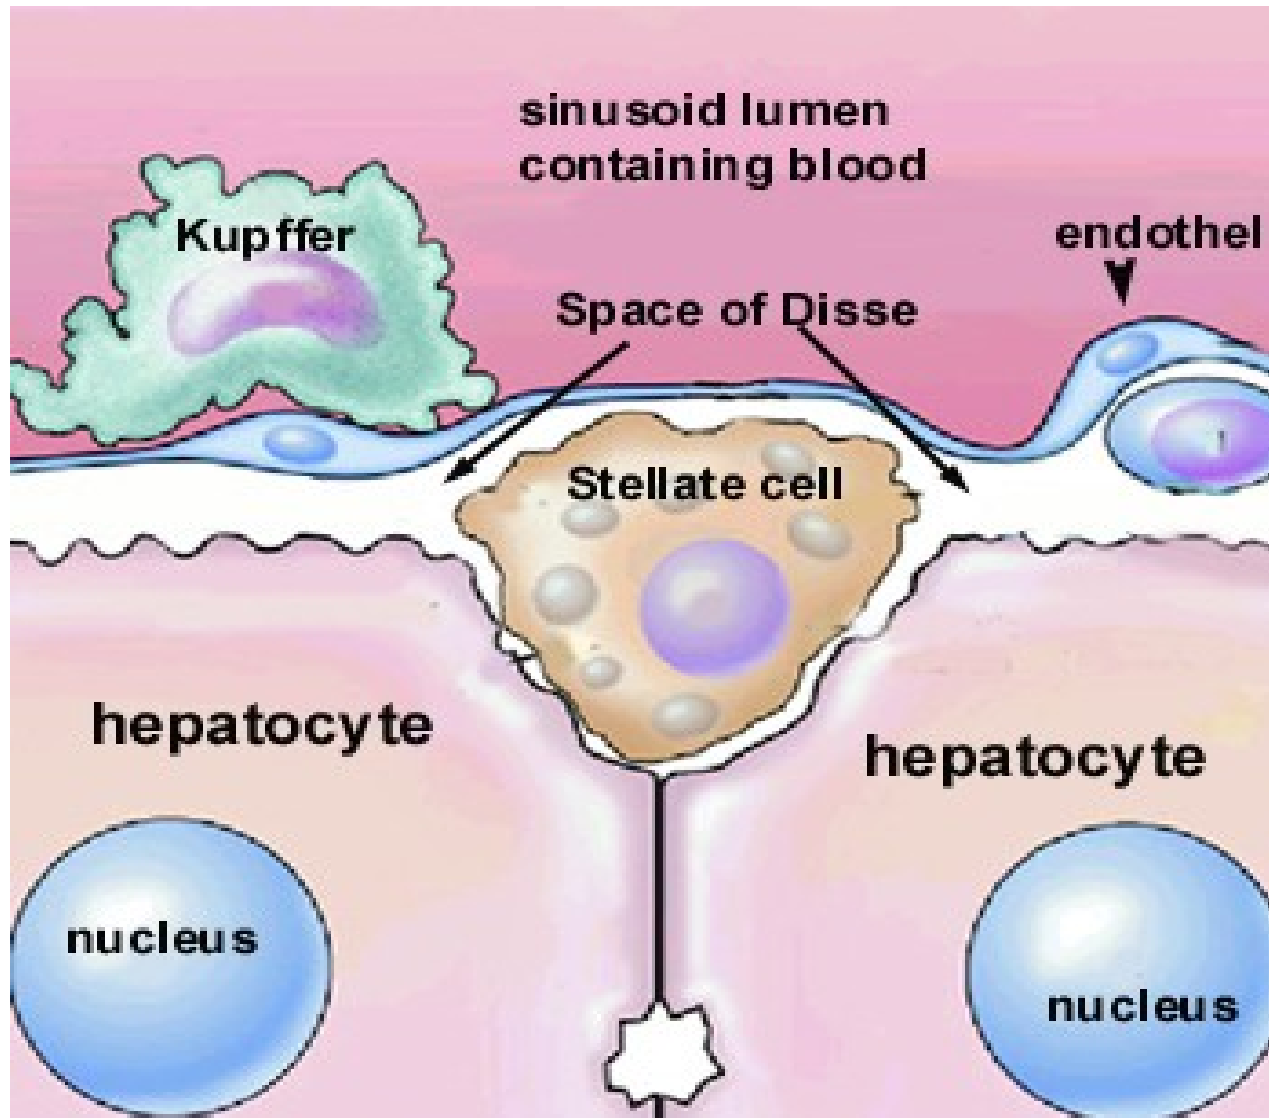

Ito cell

<https://lh3.googleusercontent.com/n10p6tXoe80FEjoaic4QTylwKiwPw4wOm1fvZF2NYgzPaAT3lOqWow0vVdj=s111>

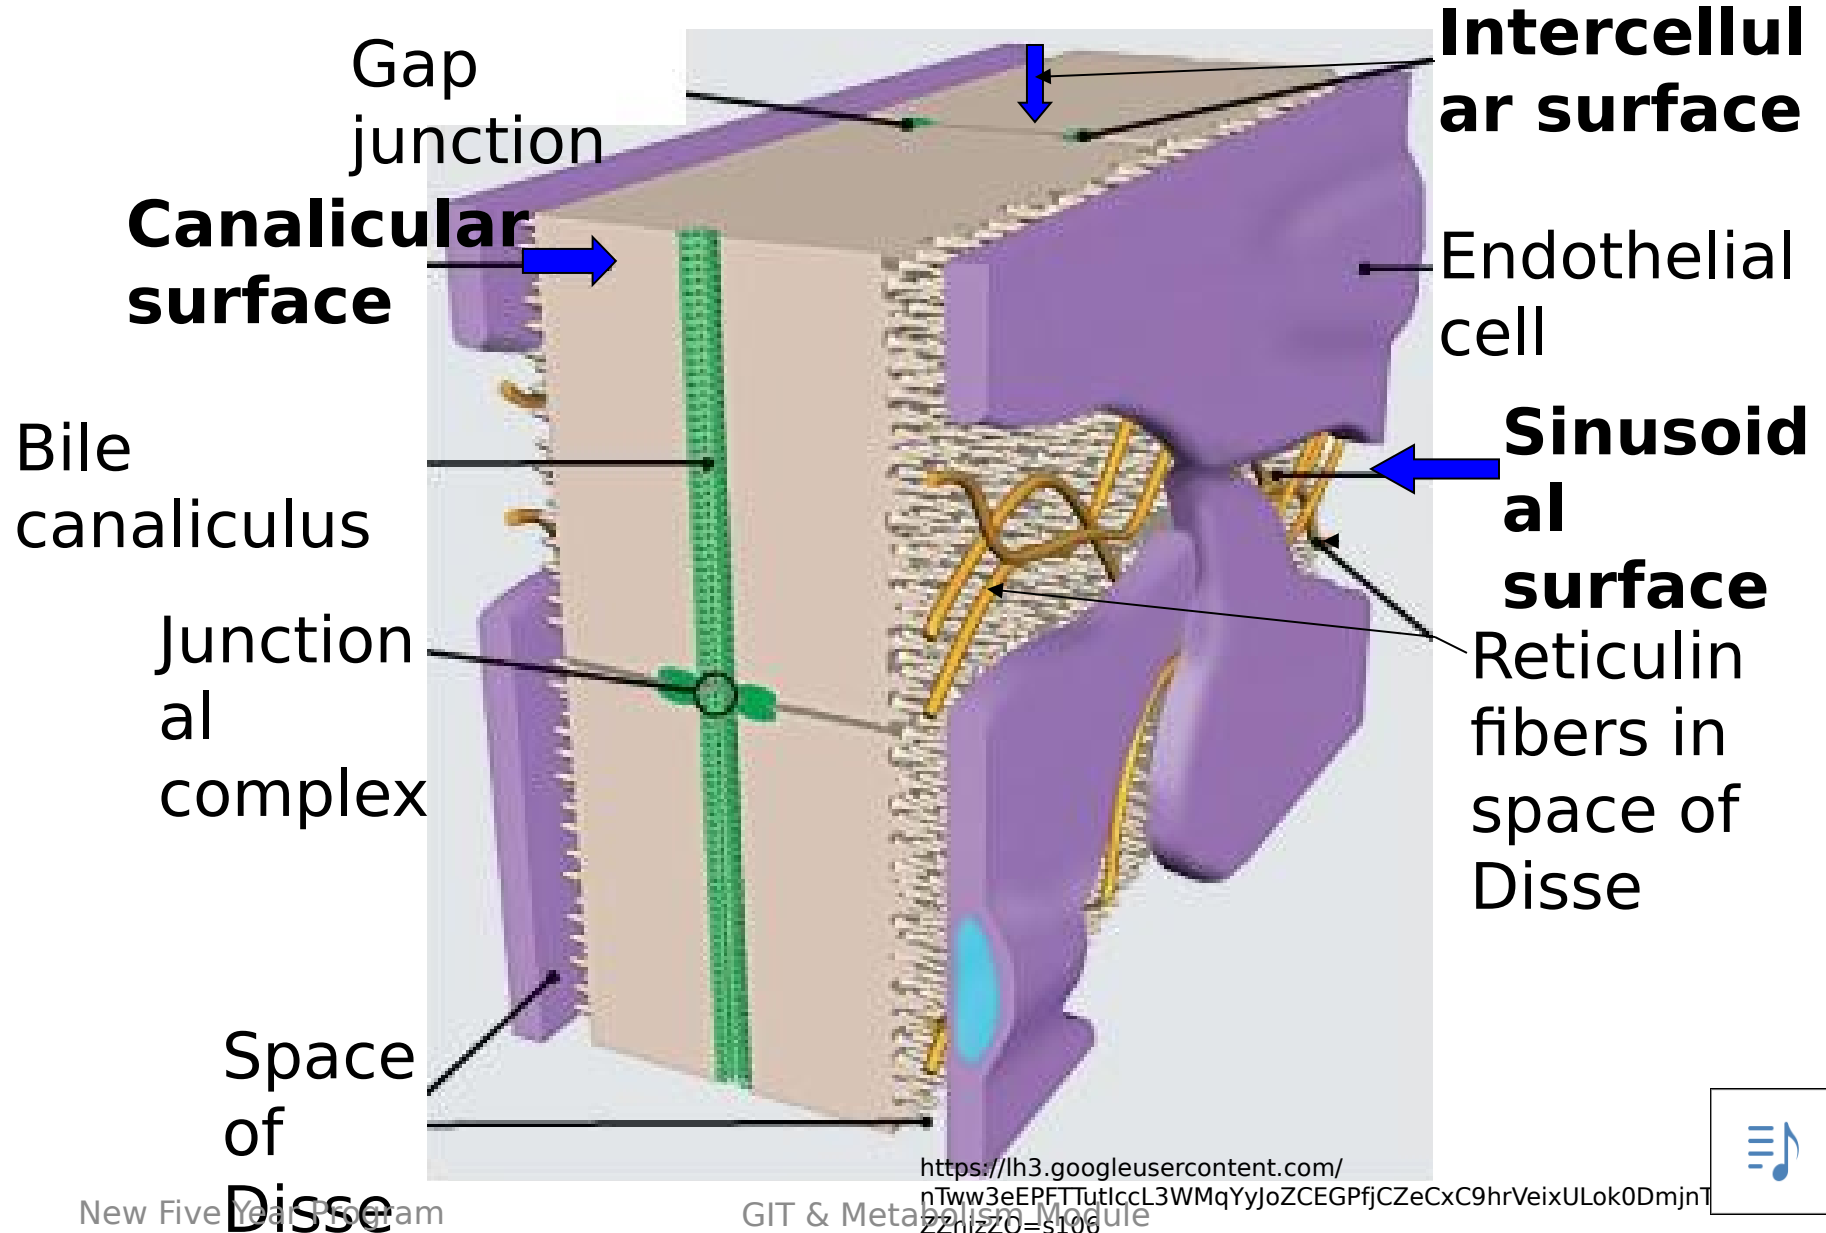

Space of Disse

The Liver

Medical Application

- **Liver fibrosis: Hepatic stellate cells** proliferate into myofibroblasts and produces connective tissue that can fill the perisinusoidal space and interfere with metabolic exchange.

Space of Disse

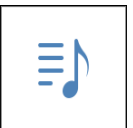

- **Function:**

1. Filtered plasma is in direct contact with the hepatocytes so it permits exchange of materials between blood and hepatocytes.
2. Prevents collapse of sinusoids. **How??**

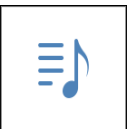

- **Liver sinusoids are prevented from collapse by:**

1. Reticular fibers for support
2. microvilli of hepatocyte
3. Hydrostatic pressure of sinusoids is similar to that space of Disse

What are the structures present in the space of Disse?

- **Microvilli**
- **Ito cells**
- **Plasma**
- **Reticular fibers**
- **Few nerve fibers**

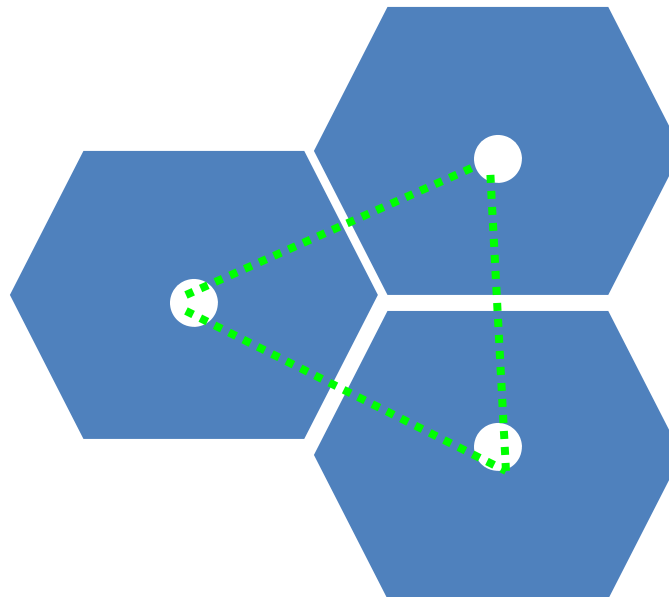

The liver

Classification of hepatocyte organization

**Liver
acinus**

**Portal
lobule**

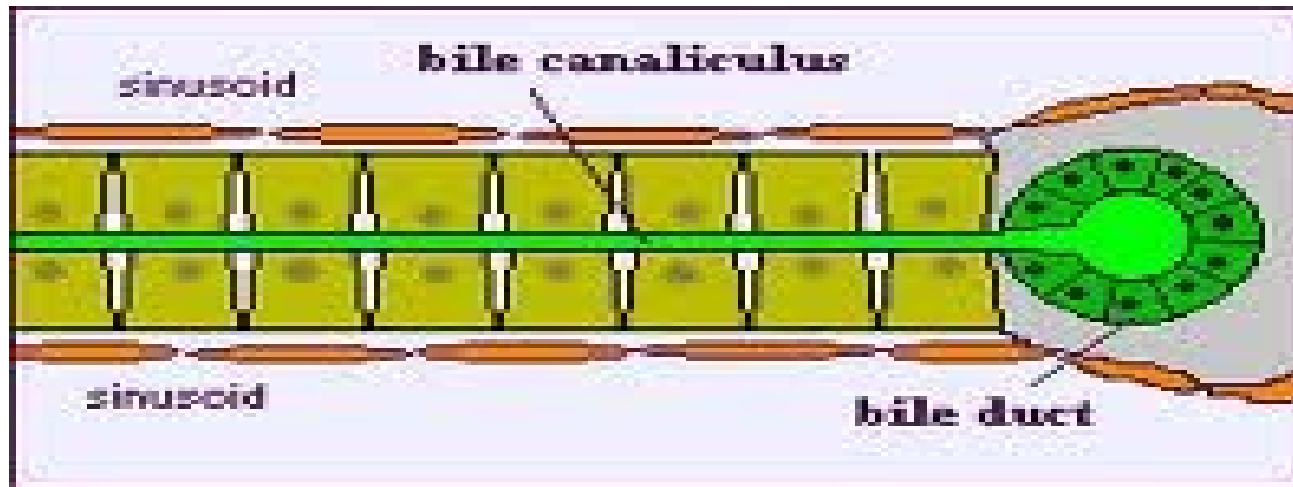

**Classic
Hepatic
lobule**

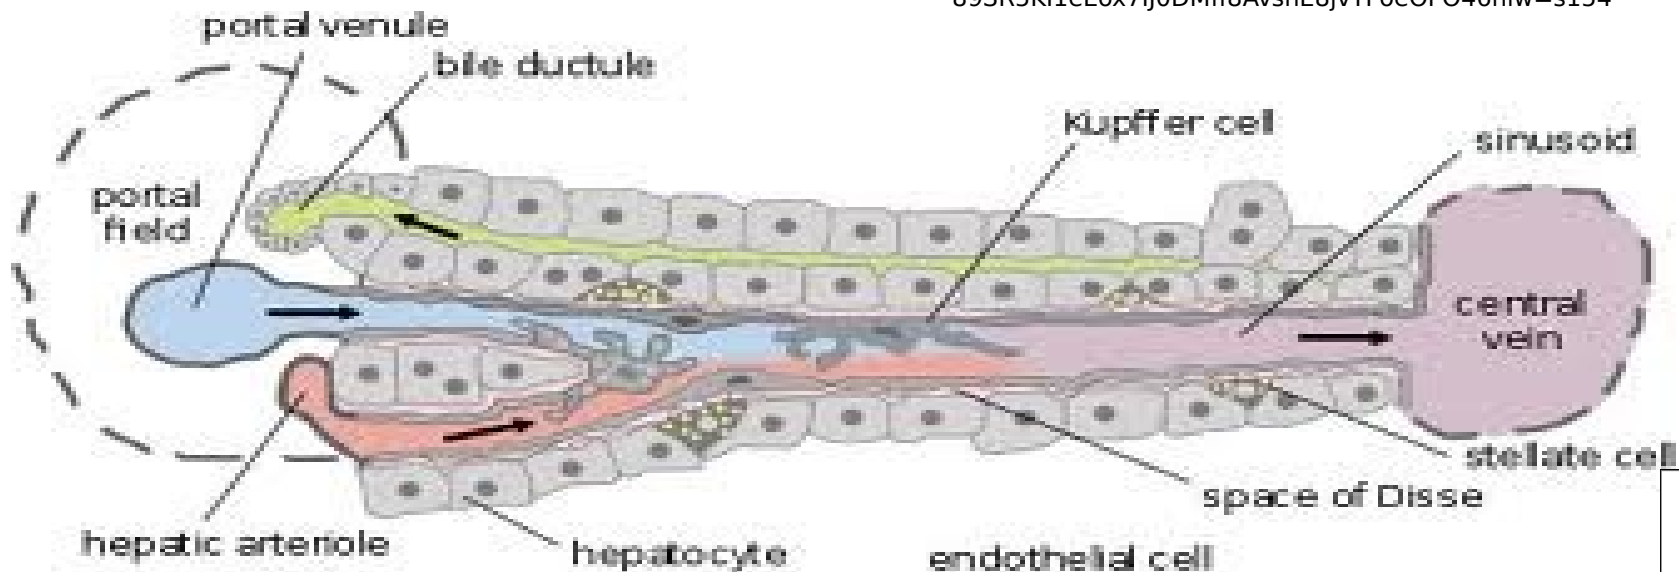

Triangular mass of liver
from 3 adjacent
lobules.
The bile is drained into
the portal tract.

Bile Flow

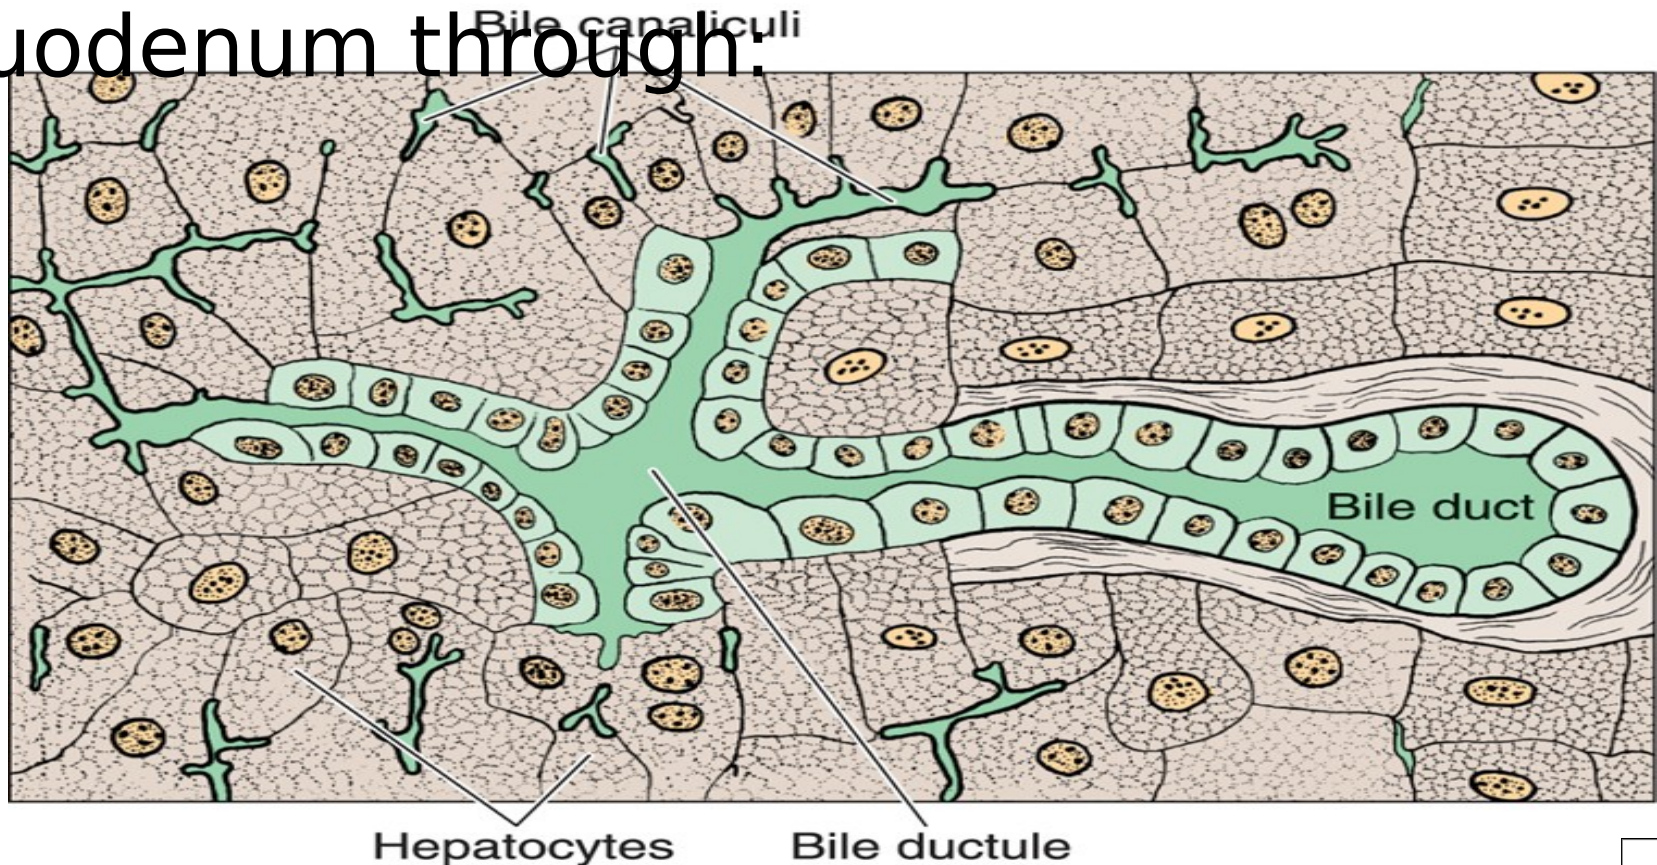

<https://lh3.googleusercontent.com/fyEsLzM4WtDGDdHjmj6pg7BnfGuc-89SR5KI1eEox7IJ0DMff8AvshE8jvYPoeOPO46nlw=s154>

Bile Flow

Bile is produced from hepatocytes and released in bile canaliculi and flows to the duodenum through:

Mescher AL: Junqueira's Basic Histology: Text and Atlas
<http://www.accessmedicine.com>

Bile Flow

- Bile canaliculi
- Canal of Herring
- Bile ductules
- Bile ducts in portal tract areas
- Intrahepatic bile duct
- Extrahepatic bile duct Rt & Lt join
- Common hepatic duct
- Common bile duct

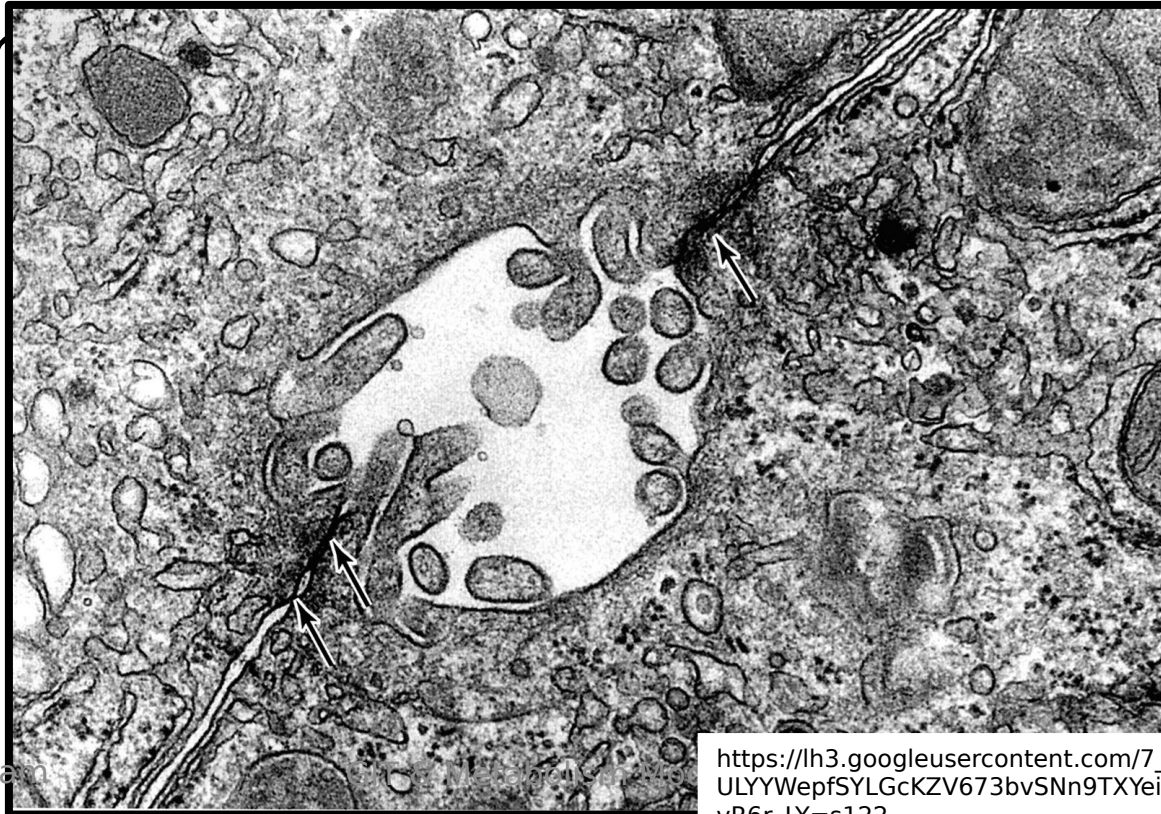

Bile Flow

- **Bile canaliculi:** lined by hepatocytes and contain microvilli from adjacent hepatocytes.

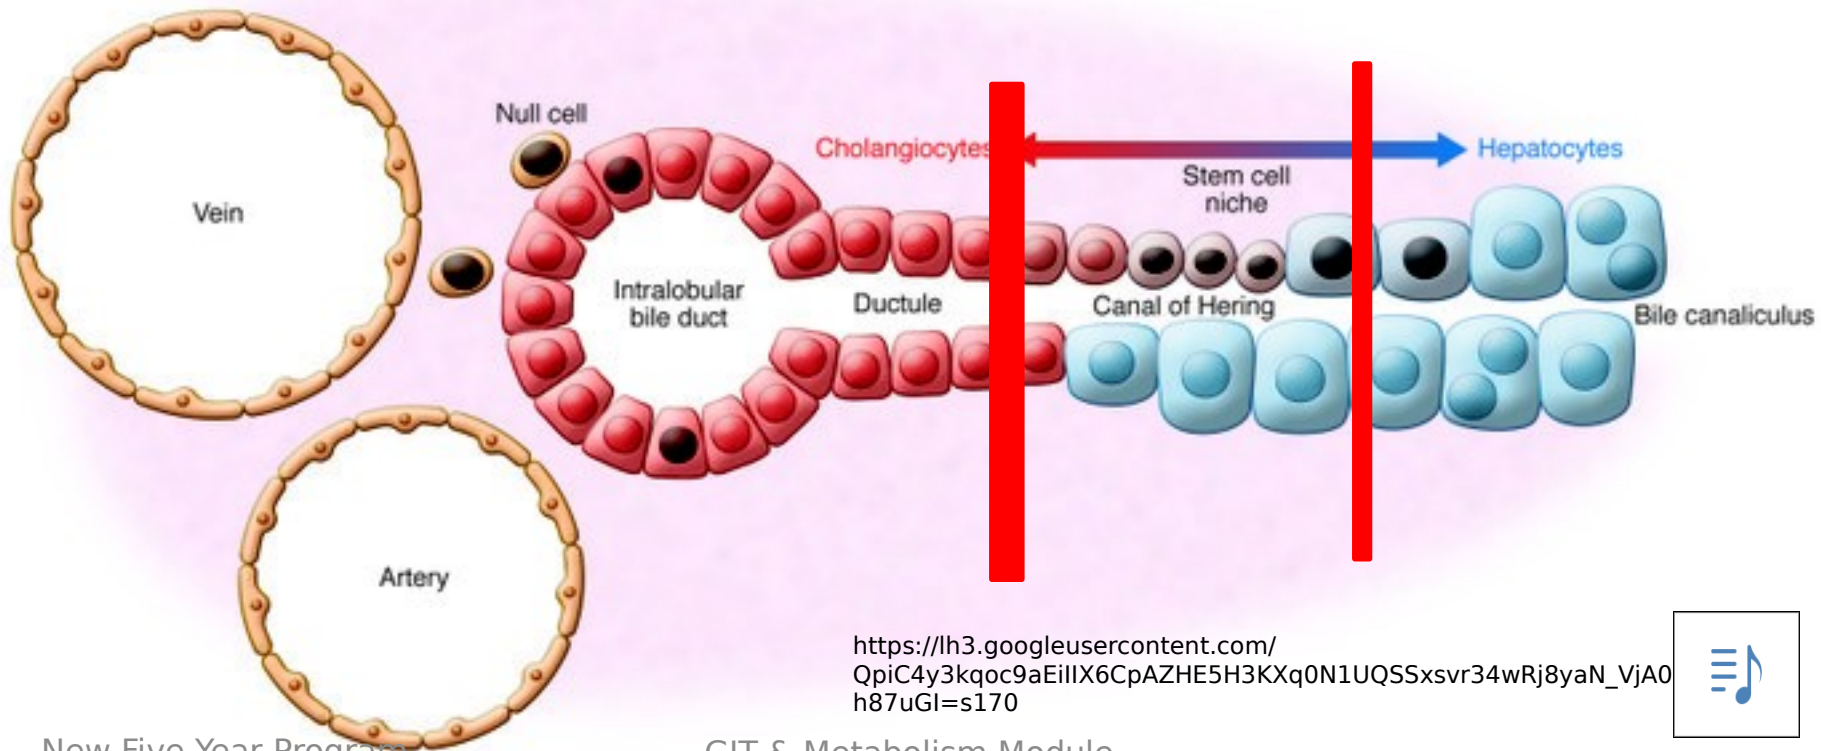

Continuous tight junctions: seal them from

Bile Flow

- **Canal of Herring:** partly lined by hepatocytes and partly by low cuboidal cells (cholangiocytes).

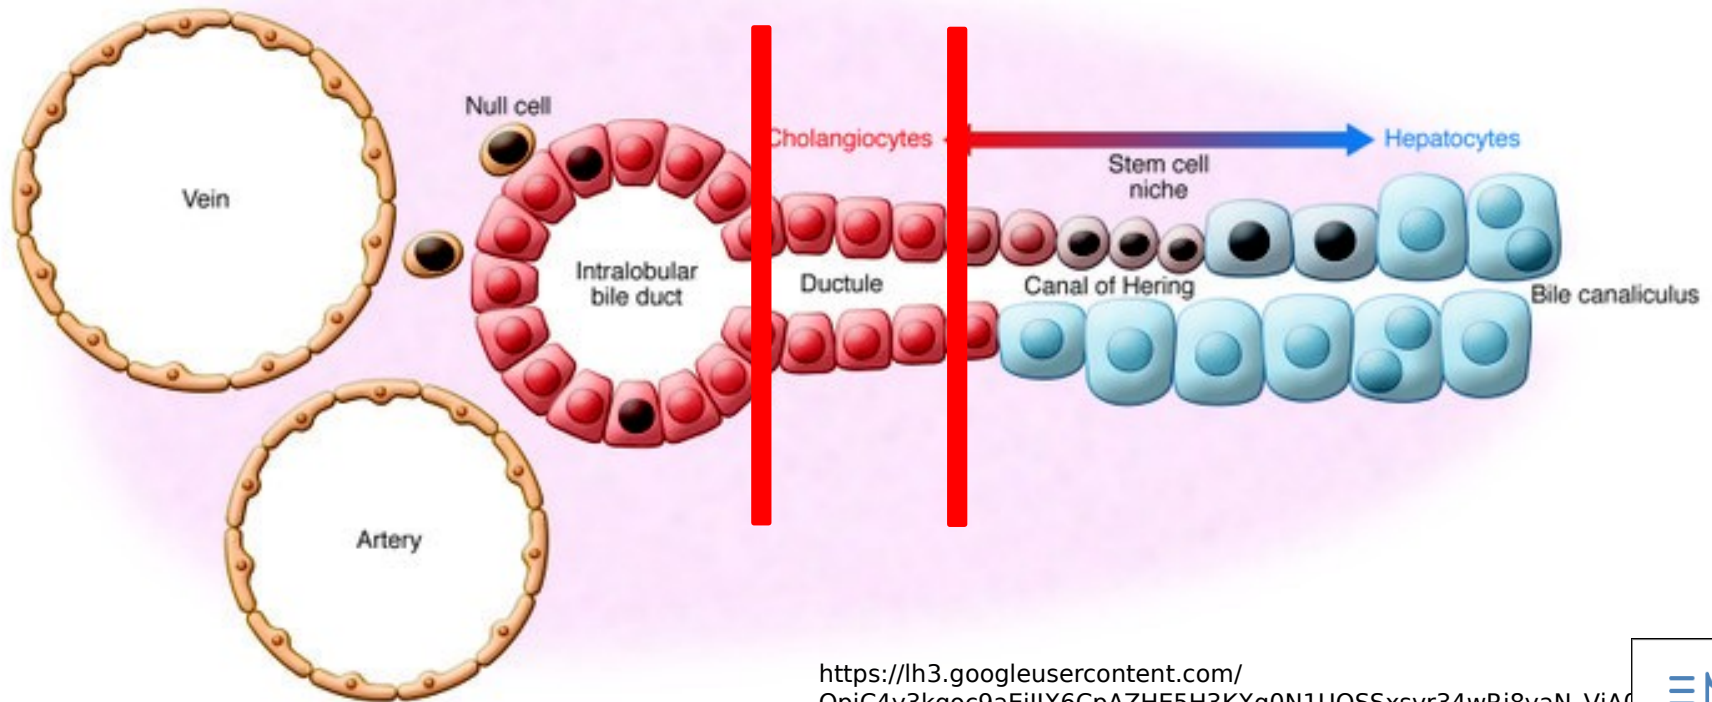

https://lh3.googleusercontent.com/QpiC4y3kqoc9aEiIlX6CpAZHE5H3KXq0N1UQSSxsvr34wRj8yaN_VjA0h87uGI=s170

Bile Flow

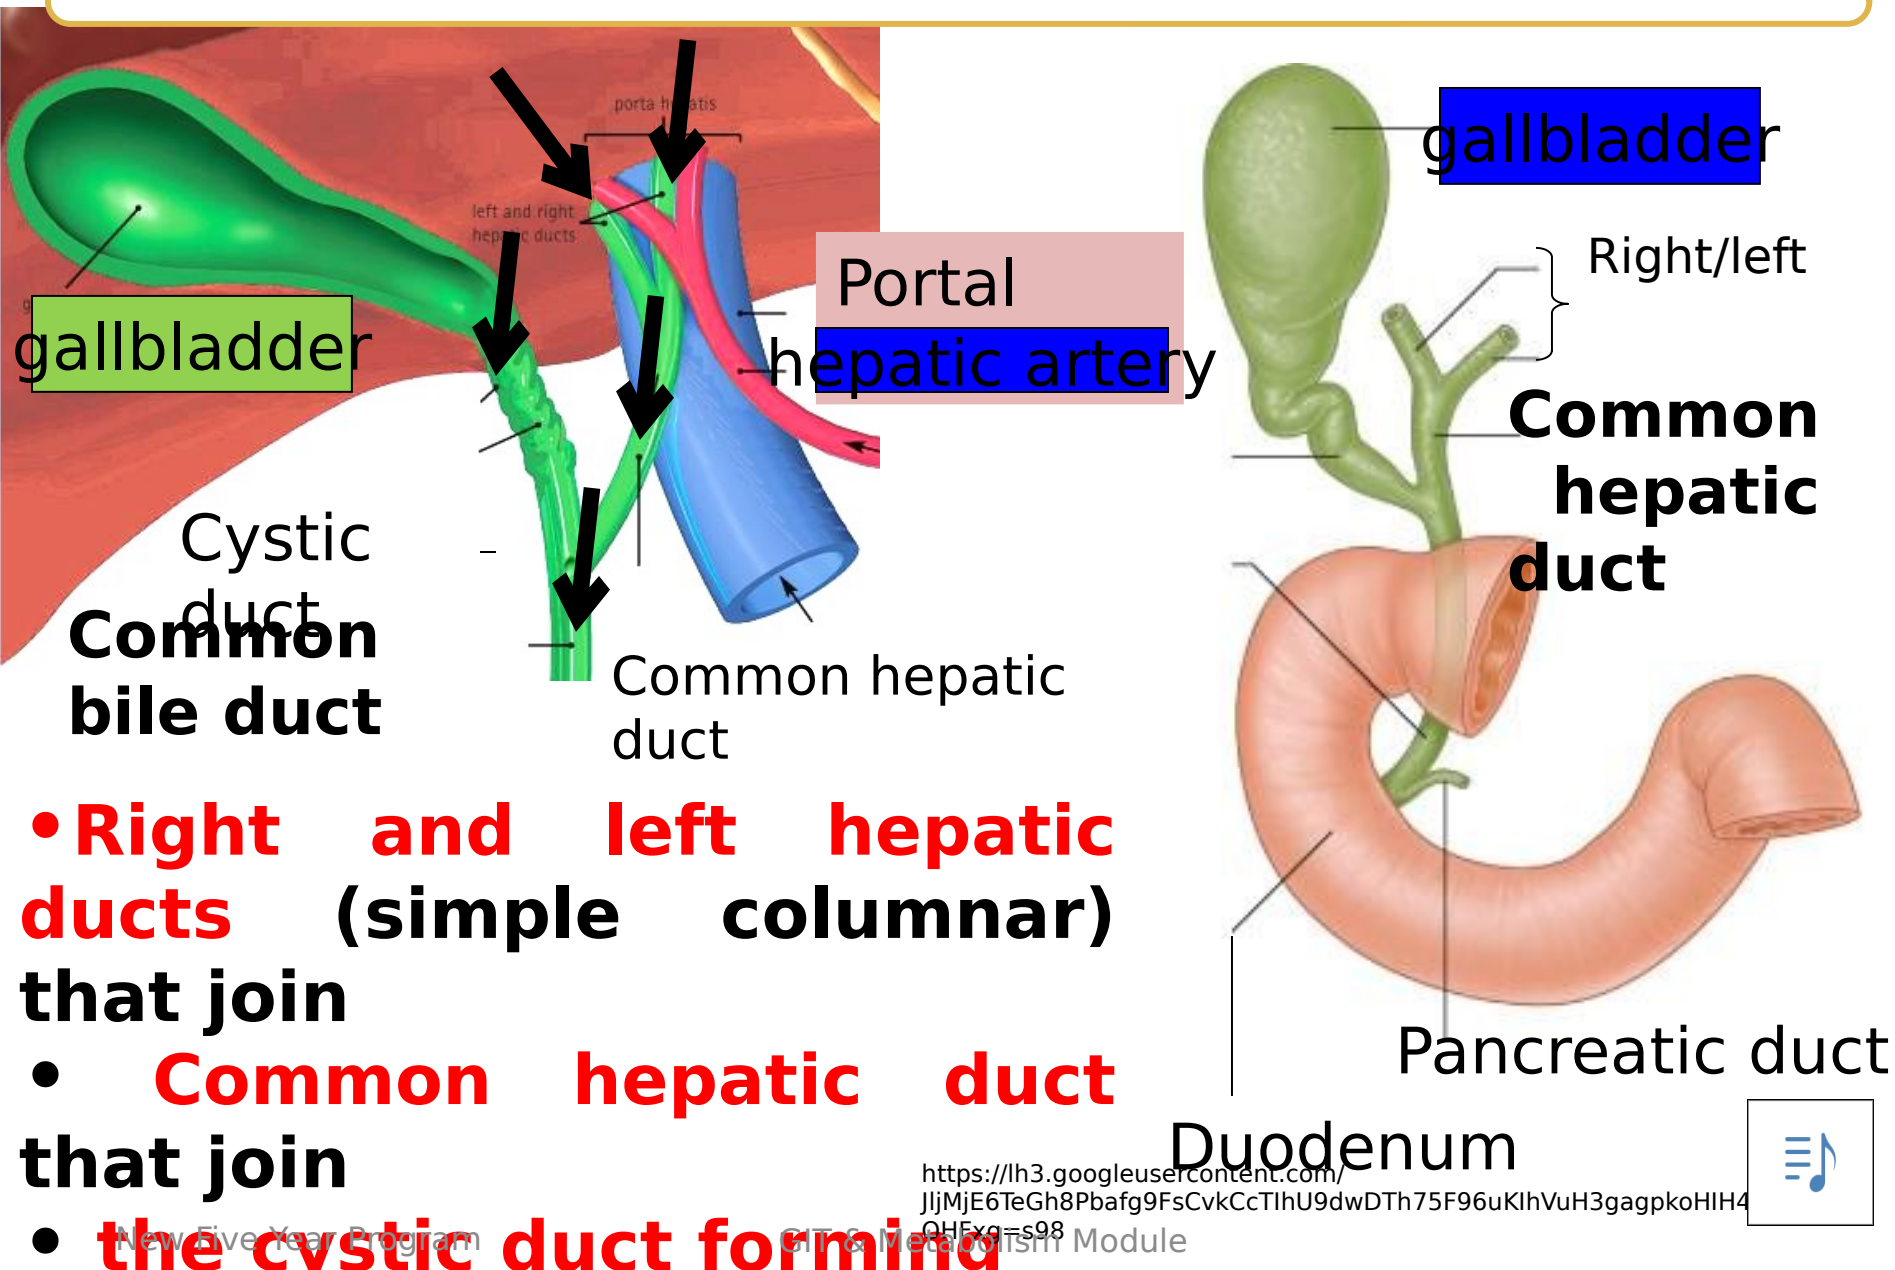

- **Bile ductules** lined by low cuboidal cells.
- **Bile ducts:** lined by cuboidal cells and are found in the portal tract areas. They

https://lh3.googleusercontent.com/QpiC4y3kqoc9aEiIX6CpAZHE5H3KXq0N1UQSSxsvr34wRj8yaN_VjACh87uGI-s170

Extrahepatic Bile ducts and Gall Bladder

Question

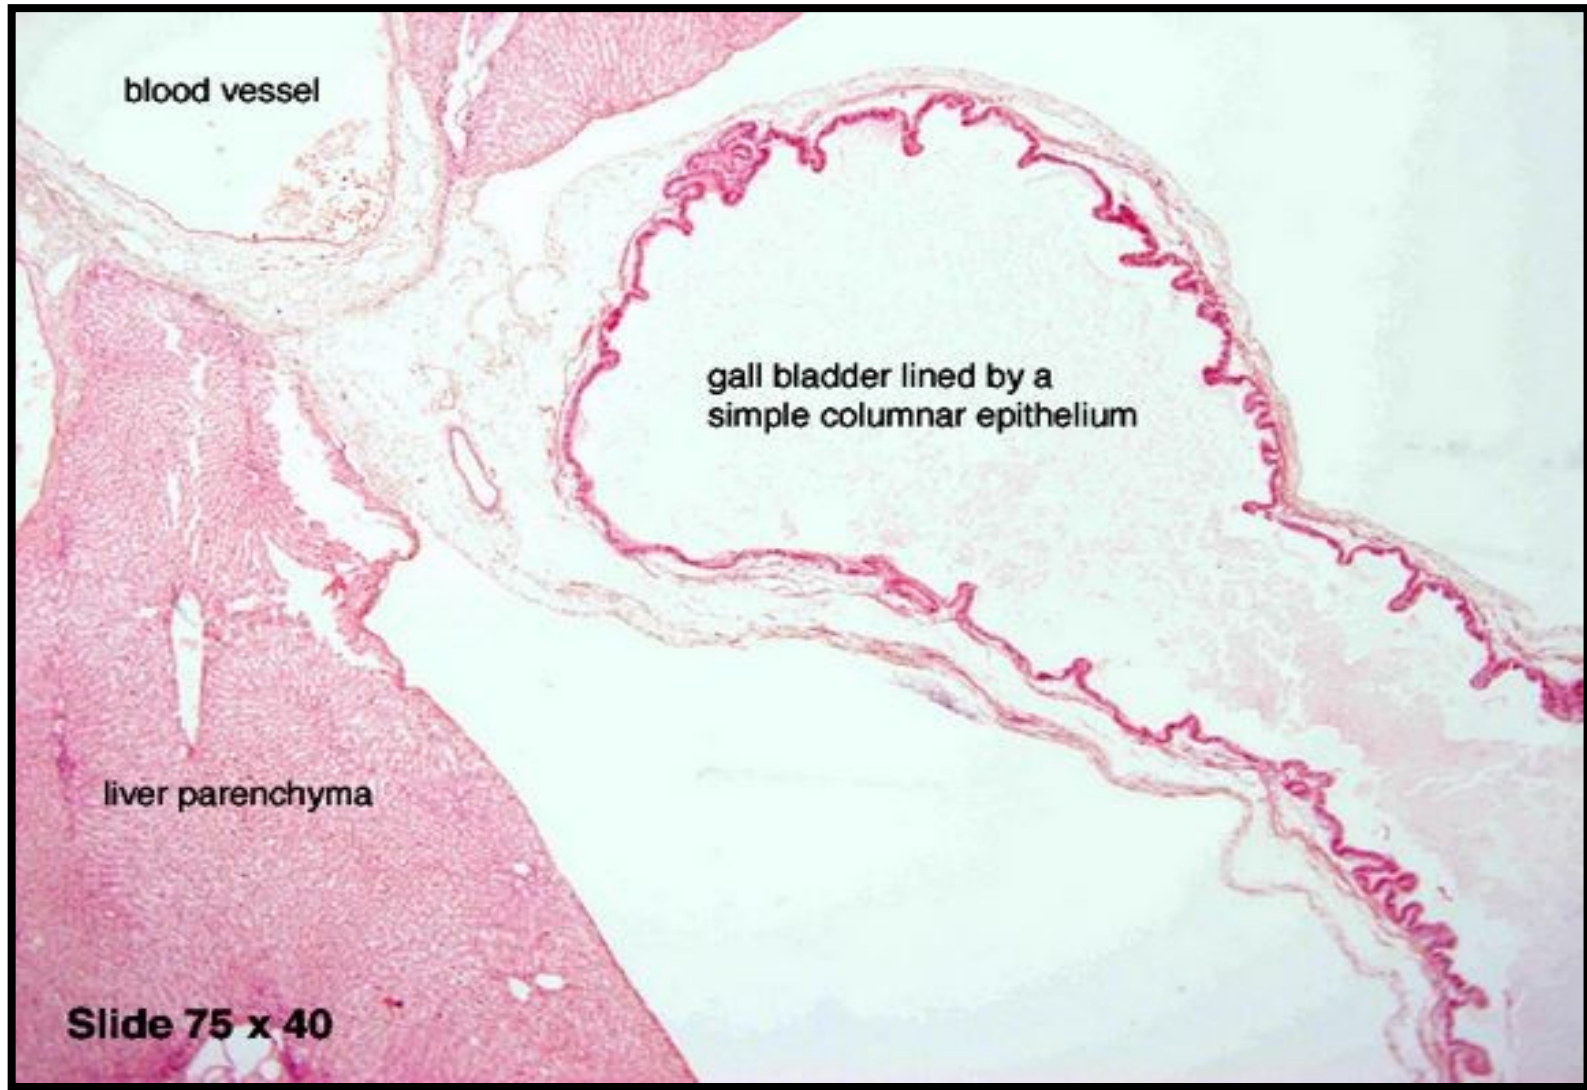

One of the following biliary passages is present in the portal tract:

- a) Bile canaliculus
- b) Herring canal
- ☒ c) Preductule
- d) Bile duct

Gall Bladder Epithelium

What is the difference between these 2 photos of columnar epithelium of gall bladder?

The Gall Bladder

- **Function:**
- Concentrates the bile (absorptive) and add mucous (secretory)
- Contraction of its smooth muscle by CCK intermittent discharge of bile in the intestine

Question

- The bile canaliculus is lined by:
 - a. cubical cells
 - ☒ b. Hepatocytes
 - c. Columnar cells
 - d. cholangiocytes

Summary

Hepatic bile sinusoids are lined by endothelial cells and von Kupffer cells.

Von Kupffer cells are phagocytic with numerous lysosomes

The space of Disse separates the hepatocytes from the blood sinusoids

It contains plasma, reticular fibers and Ito cells.

Ito cells are fat storing cells and can change to fibroblasts to cause fibrosis.

The gall bladder is formed of mucosa, muscle layer and fibrous coat.
